

TEJAS SUSHANTH H V

DevOps Engineer

Bengaluru, Karnataka | sushanthtejashv@outlook.com | +91-6360780922 | linkedin.com/in/tejas-sushanth-h-v563a553a1

PROFESSIONAL SUMMARY

AWS Certified Solutions Architect – Associate (Score: 911/1000) with demonstrated hands-on depth in Linux/Unix administration, cloud infrastructure (AWS), CI/CD pipeline engineering, scripting (Python, Bash), Docker/Kubernetes containerization, and CloudFormation-based infrastructure automation. Built and operated end-to-end observability workflows using CloudWatch, performed root-cause analysis on system and application failures, and managed the full incident lifecycle from detection through documented resolution. Brings structured troubleshooting methodology, disciplined runbook-level documentation, and the infrastructure breadth to own delivery pipelines independently from day one.

CORE TECHNICAL SKILLS

CI/CD & Automation: Jenkins (pipeline creation, build/test/deploy stages, webhook triggers, credentials management), GitLab CI/CD, GitHub Actions

Cloud (AWS): EC2, S3, IAM, VPC, Subnets, Route Tables, NAT Gateway, Security Groups, CloudWatch, SNS, Lambda, API Gateway

Containerization: Docker (multi-stage Dockerfiles, image builds, container lifecycle, volumes, bridge networking), Kubernetes (Deployments, Services, kubectl, rolling updates, pod health monitoring)

Linux / Unix Admin: User/group management, file permissions (chmod/chown), process monitoring, SSH configuration, log analysis, system diagnostics

Scripting: Python and Bash/Shell — automation scripts for system administration, environment setup, log rotation, and health checks

Monitoring & Logging: CloudWatch Alarms & Dashboards, CloudWatch Logs, Lambda execution log analysis, alert triage, ELK Stack (concepts)

Networking: DNS, IP addressing, load balancing (concepts), firewalls, security groups, NACLs, connectivity troubleshooting

IaC & Config Mgmt: AWS CloudFormation — template authoring and full infrastructure stack provisioning

Tools & Practices: Git, AWS CLI, VS Code, ServiceNow, incident lifecycle management, runbook and knowledge base documentation

HANDS-ON TECHNICAL PROJECTS

CI/CD & Infrastructure Automation Lab

- Engineered Jenkins pipelines from scratch — defined checkout, build, test, and deployment stages; configured job credentials, webhook triggers, and post-build actions to automate end-to-end pipeline execution without manual intervention.
- Authored multi-stage Dockerfiles to containerize applications; built and tagged images, managed the full container lifecycle (run, stop, remove), and configured volumes and bridge networking for inter-container communication.
- Deployed and operated applications on Kubernetes clusters via kubectl — wrote Deployment and Service YAML manifests, executed rolling updates with zero-downtime strategy, scaled pod replicas under load, and diagnosed failures using kubectl logs and describe.
- Provisioned AWS infrastructure stacks using CloudFormation templates; wrote Bash and Python scripts for environment setup, log rotation, and scheduled health checks — eliminating manual provisioning steps across environments.

System Monitoring & Incident Management Lab

- Configured CloudWatch alarms and dashboards to monitor EC2 CPU utilization, memory, and availability — establishing observable baselines and alert thresholds that mirror production SRE workflows.
- Triaged system performance alerts end-to-end: isolated root causes, documented resolution steps, and closed incident records with reproducible runbooks — targeting MTTR reduction through systematic investigation rather than ad-hoc fixes.

- ▶ Parsed CloudWatch and Lambda execution logs to surface failure patterns, runtime exceptions, and anomalies — translating raw log data into actionable diagnostics for application and infrastructure issues.
- ▶ Executed the complete incident lifecycle — detection → triage → escalation → resolution → post-incident documentation — producing structured summaries that double as knowledge base articles for future on-call reference.

Linux Administration & System Troubleshooting

- ▶ Administered Linux environments: managed users and groups, enforced file permissions (chmod/chown), monitored processes, configured SSH, and performed file system operations across multi-user setups.
- ▶ Diagnosed and resolved SSH login failures, daemon-level service outages, and network connectivity errors using command-line log analysis and system diagnostic tooling — documenting each resolution path for repeatability.
- ▶ Scripted recurring system administration tasks in Bash — replacing manual, error-prone procedures with version-controlled automation and cutting repeat-task execution time to near zero.

Cloud Infrastructure & Networking Lab

- ▶ Deployed full AWS infrastructure stacks: EC2 instances, VPCs, subnets, route tables, NAT Gateways, and security groups — applying cost-optimization tagging and least-privilege security group rules from the ground up.
- ▶ Authored IAM roles and S3 bucket policies under least-privilege principles; identified and remediated permission misconfigurations by tracing policy evaluation logic through IAM policy simulator and access advisor.
- ▶ Debugged routing and connectivity failures by systematically inspecting security group rules, NACLs, and route table entries — isolating root causes at each network layer rather than applying blanket rule changes.

CERTIFICATION

AWS Certified Solutions Architect – Associate (SAA-C03) | Score: 911/1000 | Amazon Web Services | April 2026

EDUCATION

Bachelor of Business Administration (BBA) | Seshadripuram College, Bengaluru | Graduated: 2025 | CGPA: 7.13

ADDITIONAL STRENGTHS

- ▶ Applies a layered troubleshooting methodology — isolates issues at the OS, network, IAM, and application layer before escalating, which cuts unnecessary back-and-forth in incident resolution.
- ▶ Implements security controls by default: IAM least-privilege policies, restrictive security groups, NACLs, and S3 bucket policies are the starting point, not an afterthought.
- ▶ Bridges development, QA, and operations contexts — familiar with the full software delivery chain, enabling productive collaboration on CI/CD design decisions without requiring handholding on infrastructure concepts.
- ▶ Produces documentation that outlasts the incident: runbooks, resolution summaries, and knowledge base articles written to be actionable by a new team member, not just the original author.
- ▶ Actively building toward advanced Kubernetes orchestration (Helm, RBAC), Terraform-based IaC, and Prometheus/Grafana observability — filling specific skill gaps rather than generically 'upskilling'.
